

ABSTRACT

A method, apparatus and system for minimally intrusive fiber identification includes imparting a time-varying modulation onto an optical  
5 signal propagating in an optical fiber and subsequently detecting the presence of the time-varying modulation in the optical signal transmitting through the fiber to identify the fiber. In a specific embodiment of the invention, a time-varying curvature is imposed on the fiber to be identified and the presence of the resultant time variation in the transmitted power of a propagating optical  
10 signal is subsequently detected for identification of the manipulated fiber.
